Envisium

Envisium™ is the premier class of mid-Power LEDs using TS AllnGaP chip technology. Envisium™ LEDs offer unparalleled performance, engineering and design flexibility. For the very first time, customers have options for mid-power LEDs.

Description

The Envisium™ Power PLCC-4 SMT LED is an extension of Avago's PLCC-4 SMT LEDs. The package can be driven at high current due to its superior package design. The product is able to dissipate the heat more efficiently compared to the conventional PLCC-2 SMT LEDs. These LEDs produce higher light output with better flux performance compared to the conventional PLCC-4 SMT LEDs.

The Envisium™ Power PLCC-4 SMT LEDs are designed for higher reliability, better performance, and operate under a wide range of environmental conditions. The performance characteristics of these new mid-power LEDs make them uniquely suitable for use in harsh conditions such as in automotive applications, and in electronics signs and signals.

To facilitate easy pick and place assembly, the LEDs are packed in EIA-compliant tape and reel. Every reel is shipped in single intensity and color bin (except for red), to provide close uniformity. These LEDs are compatible with the IR solder reflow process. Due to the high reliability feature of these products, they also can be mounted using through-the-wave soldering process.

The Envisium™ Power PLCC-4 SMT LED is available in 3 colors, red, red-orange and amber.

Notes

1. The luminous intensity, I_v , is measured at the mechanical axis of the lamp package. The actual peak of the spatial radiation pattern may not be aligned with this axis.
2. Φ_V is the total luminous flux output as measured with an integrating sphere after the device has stabilized.
3. Flux tested at mono pulse conditions.
4. Tolerance = $\pm 12\%$

Notes:

- The dominant wavelength, λ_D, is derived from the CIE Chromaticity Diagram and represents the color of the device.
- θ^{1/2} is the off-axis angle where the luminous intensity is 1/2 the peak intensity.
- Radiant intensity, I_e in watts/steradian, may be calculated from the equation I_e = I_v/η_v, where I_v is the luminous intensity in candelas and η_v is the luminous efficacy in lumens/watt.
- Φ_v is the total luminous flux output as measured with an integrating sphere at mono pulse conditions.

This product is qualified as Moisture Sensitive Level 2a per Jec J-STD-020. Precaution when handling this moisture sensitive product is important to ensure the reliability of the product. Do refer to Avago Application Note AN5305 Handling of Moisture Sensitive Surface Mount Devices for details.

A. Storage before use

- Unopen moisture barrier bag (MBB) can be stored at <math><40^{\circ}\text{C}/90\% \text{RH}</math> for 12 months. If the actual shelf life has exceeded 12 months and the HIC indicates that baking is not required, then it is safe to reflow the LEDs per the original MSL rating.
- It is not recommended to open the MBB prior to assembly (e.g., for IQC).

B. Control after opening the MBB

- The humidity indicator card (HIC) shall be read immediately upon opening of MBB.

- The LEDs must be kept at <math><30^{\circ}\text{C}/60\% \text{RH}</math> at all times and all high temperature related processes, including soldering, curing or rework, need to be completed within 672 hours.

C. Control for unfinished reel

- For any unused LEDs, they need to be stored in sealed MBB with desiccant or desiccator at <math><5\% \text{RH}</math>.

D. Control of assembled boards

- If the PCB soldered with the LEDs is to be subjected to other high temperature processes, the PCB needs to be stored in sealed MBB with desiccant or desiccator at <math><5\% \text{RH}</math> to ensure no LEDs have exceeded their floor life of 672 hours.

E. Baking is required if:

- "10%" is Not blue and "5%" HIC indicator turns pink.
- The LEDs are exposed to condition of >math>30^{\circ}\text{C}/60\% \text{RH}</math> at any time.
- The LEDs floor life exceeded 672 hours.

Recommended baking condition: $60 \pm 5^{\circ}\text{C}$ for 20 hours.
