

GB HUMIDITY KILLER

Instructions for use: This system for dehumidifying rooms is extremely efficient and easy in its application. Place the container where you want to dehumidify.

ATTENTION! Remove the protective plastic bags only if you wish the dehumidifying process to begin. Place the block on the grid that is to be placed in the collecting container. Then place the plastic cover

on top. The dehumidifying process can begin. Through observation you will notice that the consumption of granules in very damp rooms is more rapid at first and slows down from week to week. The absorption of the remaining granules will not be restricted by this. The liquid absorbed by the granules will be collected as fluid in the larger container.

Important: As long as the block is sealed in the plastic bag, the active substances will hold their total absorption capacity. This enables you to stock up with replacement packs. The fact that water is not deposited in the collecting container right from the beginning does not mean that the dehumidifying process has not yet begun. This Humidity Killer is a design based on the most up-to-date knowledge available. Please take into consideration that the Humidity Killer absorbs/deposits water only after a certain level of humidity has been reached. Further, the Humidity Killer requires a certain amount of time before it is activated (visibly). That means that the dehumidifying process actually begins before it is visible to the naked eye.
