ASTRO PI: SOFTWARE SETUP

This guide assumes you have an SD card loaded with NOOBS/Raspbian. If not, see the Downloads section to download NOOBS/Raspbian and use the NOOBS setup guide for help with installation.

Connect your Sense HAT and boot it up.

ASTRO PI DRIVER INSTALLATION

Ensure your Pi is connected to the internet, then run the following command (from the command prompt or a Terminal window) to download and start the Astro Pi installation script:

```
wget -O - http://www.raspberrypi.org/files/astro-pi/astro-pi-install.sh --no-check-certificate | bash
```

This will take about 5 minutes on a Pi 2 and about 15 to 20 minutes on a Pi 1. When it's finished you'll see the following message:

```
You must reboot to complete the Astro Pi installation
Type:
sudo reboot
and press Enter when ready
```

Reboot the Raspberry Pi to complete the installation:

```
sudo reboot
```

The rainbow pattern on the LED matrix should now turn off during boot up.
