## FUJITSU SEMICONDUCTOR FACT SHEET

#### NP501-00019-2v0-E

# FRAM MB85RC256V

MB85RC256V is a 256K-bits FRAM with serial interface ( $I^2C$ ), using the ferroelectric process and CMOS process technologies for forming the nonvolatile memory cells. Because FRAM is able to write high-speed even though a nonvolatile memory, it is suitable for the log management and the storage of the resume data, etc.

#### FEATURES

- Bit configuration
- Two-wire serial interface
- Operating frequency
- Read/write endurance
- Data retention
- Operating power supply voltage
- Low power consumption
- : Operating current 200µA (Max. @1MHz), : Standby current 27µA (Typ.)

: 32,768 words  $\times 8$  bits

: 1 MHz (Max.) : 10<sup>12</sup> times / byte

: 2.7V to 5.5V

: Fully controllable by two ports through serial clock (SCL) and serial data (SDA).

: 10 years (+85 °C), 95 years (+55 °C), over 200 years (+35 °C)

- Operation ambient temperature range : 40 °C to + 85 °C
- Package

- : 8-pin plastic SOP (FPT-8P-M02)
- : 8-pin plastic SOP (FPT-8P-M08)
- RoHS compliant

#### ■ ORDERING INFORMATION

Product name	Package	Shipping form			
MB85RC256VPNF-G-JNE1	8-pin plastic SOP	Tube			
MB85RC256VPNF-G-JNERE1	(FP1-8P-M02) 3.90mm×5.05mm,1.27mm pitch	Embossed Carrier tape			
MB85RC256VPF-G-JNE2	8-pin plastic SOP	Tube			
MB85RC256VPF-G-JNERE2	5.30mm×5.24mm,1.27mm pitch	Embossed Carrier tape			

#### ■ PACKAGE EXAMPLE

## MB85RC256V

#### ■PIN ASSIGNMENT

#### BLOCK DIAGRAM

## ∎I<sup>2</sup>C

The MB85RC256V has the two-wire serial interface; the I<sup>2</sup>C bus, and operates as a slave device. The I<sup>2</sup>C bus defines communication roles of "master" and "slave" devices, with the master side holding the authority to initiate control. Furthermore, the I<sup>2</sup>C bus connection is possible where a single master device is connected to multiple slave devices in a party-line configuration. In this case, it is necessary to assign a unique device address to the slave device, the master side starts communication after specifying the slave to communicate by addresses.

# Overview

You're probably familiar with SRAM, DRAM, EEPROM and Flash but what about FRAM? FRAM is 'ferroelectric' RAM, which has some very interesting and useful properties. Unlike SRAM, FRAM does not lose the data when power is lost. In that sense it's a durable storage memory chip like Flash. However, it is much faster than Flash - and you don't have to deal with writing or erasing pages.

This particular FRAM chip has 256 Kbits (32 KBytes) of storage, interfaces using I2C, and can run at up to 1MHz I2C rates. Each byte can be read and written instantaneously (like SRAM) but will keep the memory for 95 years at room temperature. Each byte can be read/written 10,000,000,000,000 times so you don't have to worry too much about wear leveling.

With the best of SRAM and Flash combined, this chip can let you buffer fairly-high speed data without worrying about data-loss.

# Pinouts

The FRAM chip is the little guy in the middle. On the bottom we have the power and interface pins

## Power Pins:

- **VCC** this is the power pin. Since the chip uses 3-5VDC you should pick whatever the logic voltage you're using. For most Arduino's that's 5V.
- **GND** common ground for power and logic

## I2C Logic pins:

- **WP** Write Protect pin. This is used to force write protection so you cannot write to the FRAM. It has an internal pulldown. Bring to a high voltage (VCC) to turn on WP
- **SCL** I2C clock pin, connect to your microcontrollers I2C clock line.

- **SDA** I2C data pin, connect to your microcontrollers I2C data line.
- **A2, A1, A0** These are the I2C address selection pins. By default the I2C address is 0x50. Connecting these pins to VCC and power cycling the chip will adjust the lower three bits of the address. For example, if A0 is high, the address is 0x51. If A1 and A2 are high, the address is 0x56

# Assembly

Prepare the header strip: Cut the strip to length if necessary. It will be easier to solder if you insert it into a breadboard - **long pins down** 

## Add the breakout board:

Place the breakout board over the pins so that the short pins poke through the breakout pads

## And Solder!

Be sure to solder all pins for reliable electrical contact.

(For tips on soldering, be sure to check out our Guide to Excellent Soldering (http://adafru.it/aTk)).

You're done! Check your solder joints visually and continue onto the next steps

# Wiring and Test Arduino Wiring

You can easily wire this breakout to any microcontroller, we'll be using an Arduino

- Connect **Vcc** to the power supply, 3V or 5V is fine. Use the same voltage that the microcontroller logic is based off of. For most Arduinos, that is 5V
- Connect **GND** to common power/data ground
- Connect the SCL pin to the I2C clock SCL pin on your Arduino. On an UNO & '328 based Arduino, this is also known as A5, on a Mega it is also known as digital 21 and on a Leonardo/Micro, digital 3
- Connect the SDA pin to the I2C data SDA pin on your Arduino. On an UNO & '328 based Arduino, this is also known as A4, on a Mega it is also known as digital 20 and on a Leonardo/Micro, digital 2

The I2C FRAM has a default I2C address of **0x50** but you can set the address to any of 8 values between 0x50 and 0x57 so you can have up to 8 of these chips all sharing the same SCL/SDA pins. We suggest just connecting up the power and SDA/SCL pins for now. Once you have things working, change up the address as desired.

# Download Adafruit\_FRAM\_I2C

To begin reading and writing data to the chip, you will need to download Adafruit\_FRAM\_I2C from our github repository (http://adafru.it/dtq). You can do that by visiting the github repo and manually downloading or, easier, just click this button to download the zip

## Download Adafruit FRAM i2c Library

#### http://adafru.it/dtr

Rename the uncompressed folder Adafruit\_FRAM\_I2C and check that the Adafruit\_FRAM\_I2C folder contains Adafruit\_FRAM\_I2C.cpp and Adafruit\_FRAM\_I2C.h

Place the **Adafruit\_FRAM\_I2C** library folder your **arduinosketchfolder/libraries/** folder.

You may need to create the **libraries** subfolder if its your first library. Restart the IDE.

We also have a great tutorial on Arduino library installation at: http://learn.adafruit.com/adafruit-all-about-arduino-libraries-install-use (http://adafru.it/aYM)

# Load Demo

Open up **File->Examples->Adafruit\_FRAM\_I2C->MB85RC256V** and upload to your Arduino wired up to the sensor

0	MB85RC256V   Arduino 1.0.5		Adafruit_CC3000	*	
File	e Edit Sketch Tools Help			ĺ	
	New Open	Ctrl+N Ctrl+O	Adafruit_FastFioraPixel Adafruit_Fingerprint Adafruit_FloraPixel	• • •	
	Sketchbook	•	Adafruit_FRAM_I2C	•	MB85RC256V
	Examples Close Save Save As Upload Upload Using Programmer	Ctrl+W Ctrl+S Ctrl+Shift+S Ctrl+U Ctrl+Shift+U	Adafruit_FRAM_SPI Adafruit_FT6206 Adafruit_GP9002 Adafruit_GPS Adafruit_GSL168x Adafruit_HMC5883_U	* * * * * *	
	Page Setup Print Preferences	Ctrl+Shift+P Ctrl+P Ctrl+Comma	Adafruit_HTU21DF Adafruit_HX8340B Adafruit_IL19340 Adafruit_IL19341	* * * *	
	Quit	Ctrl+Q	Adafruit_INA Adafruit_L3GD20	*	

Thats it! Now open up the serial terminal window at 9600 speed to begin the test.

The test is fairly simple - It first verifies that the chip has been found. Then it reads the value

written to location #0 in the memory, prints that out and write that value + 1 back to location #0. This acts like a restart-meter: every time the board is reset the value goes up one so you can keep track of how many times its been restarted.

Afterwards, the Arduino prints out the value in every location (all 256KB!)

## Library Reference

The library we have is simple and easy to use

You can create the FRAM object with

## Adafruit\_FRAM\_I2C fram = Adafruit\_FRAM\_I2C();

Then when you **begin**(), pass in the i2c address. The default is 0x50 so if you don't put any value in the default is used. If you have different addresses, call something like

## fram.begin(0x53)

for example.

Then to write a value, call

## fram.write8(address, byte-value);

to write an 8-bit value to the address location Later on of course you can also read with

## fram.read8(address);

which returns a byte reading.
