

VoiceBridge

Intercomsystem

The VoiceBridge is a contactless, fully automatic intercom set. It helps entrepreneurs to keep communication with customers at cash registers and information desks clear and understandable despite protective measures, safety distance, hygiene walls and protective masks.

The set consists of two microphone units (one on the customer / personnel side), a power supply unit and the necessary cables. A complex integration into existing systems is not necessary. The VoiceBridge is easy to install and runs completely independently, safely and stably.

Infrared sensors detect whether a person is standing in front of the device. This suppresses ambient noise and disturbing echoes during communication (echo cancellation / noise reduction). Extra loud speaking is not necessary. This guarantees hygienic (and therefore) safe and, above all, understandable communication.

The contact stations can be easily cleaned using any common surface cleaner. In this way, the system can be easily integrated into individual hygiene and safety concepts and even easily upgraded, e.g. POS, visit aid for nursing homes, info points and check-in counters. The VoiceBridge can also serve as a communication support for radiologists or pulmonologists, where the patients and staff are often separated by a door during the examination. Another area of application are consultations e.g. in banks and car dealerships etc., which require the highest possible protection against infection for customers and employees.

The VoiceBridge is suitable for use on any hygienic protective wall made of acrylic glass or (real) glass.

Technical Datas	VoiceBridge
Operating Voltage	12VDC
Audio IN	-
Audio OUT	-
Connections / Interfaces	connction sockets for included cable
Dimensions	110,5x86x26 mm
Material	Housing: plastic
