Note:

2: The typical value of output efficiency is based on module is full loaded and burned-in after half an hour.

3: The fluctuation range of full load efficiency (%typ) in table is ±2%, full load efficiency = output power/module's input power. Note 4: Ripple & noise is tested by twisted pair method, details please refer to ripple & noise test at back.

Product characteristic curve

Note

1: Input Voltage should be derated based on Input voltage derating curve when it is 85~100VAC/277~305VAC/120~140VDC/ 390~430VDC

2: Our product is suitable to use under natural air cooling environment, if use it under closed condition, please contact with us.

Dimensions and recommended layout - standard package

Note: If the definition of pin is not in accordance with the model selection manual, please refer to the label on actual item.

Dimensions and recommended layout - L-shaped bent pins

Ripple & noise test: (twisted pair method 20MHz bandwidth)

- Test Method:
1. Connect the twisted pair, set the oscilloscope bandwidth to 20MHz, use a 100M bandwidth probe, and terminate with a 0.1uF polypropylene capacitor and a 10uF high-frequency low-resistance electrolytic capacitor in parallel. Configure the oscilloscope to sample mode.
 2. Connect the input terminal to the power supply and the output terminal to the electronic load using a jig plate. Use a 30cm (±2 cm) sampling line, and select the power line from appropriately insulated wires of the corresponding diameter according to the output current flow.
